

Product Manager Critical Review — Campus Events & Clubs

Digital Campus → Campus Services | Team 12 | MVP PRD Review

1. Product Value & Problem

Strength: The PRD has a clear core value proposition: students should be able to discover an activity, understand its details, register, manage their registration, and cancel when needed. The problem is also connected to a real student pain point—information being distributed across different channels. **PM concern:** the PRD explicitly treats these problem statements as assumptions, so user validation is still needed before treating them as proven needs.

2. Scope & Prioritization

Strength: The MVP boundary is unusually clear. Core registration workflows are in scope, while payments, chat, AI recommendations, gamification, mobile apps, QR check-in, and advanced analytics are excluded. This is appropriate for five students, one semester, and a 0 THB deployment budget. **Recommendation:** protect the Discover → View → Register → Confirm → Cancel journey from scope creep and prioritize business-critical requirements before future improvements.

3. Requirements Quality

Strength: Functional requirements are specific and testable, including duplicate-registration prevention, ownership rules, authentication, and organizer permissions. The NFRs are also measurable: 80% task completion for usability and 95% of ordinary API requests within 2 seconds under the agreed classroom load. **Gap:** the PRD does not yet define how representative users will be selected or how the usability/performance tests will be conducted. These should be agreed before final acceptance.

4. User & Business Risk

Risk	PM Assessment	Action
Low adoption	Students may still rely on existing channels.	Validate the problem with student interviews/surveys and test whether the core journey is actually useful.
Incorrect access	Registration and organizer data are privacy-sensitive.	Keep role/resource ownership checks mandatory at the API/database level.
Scope creep	Future features could distract from MVP delivery.	Treat future improvements as backlog items, not MVP commitments.

5. Product Decisions I Would Prioritize

- **Validate the problem first:** confirm that students genuinely struggle to discover and manage campus activities.
- **Define MVP acceptance early:** use the listed acceptance checks as the release gate, especially registration, cancellation, authorization, and deployment.
- **Clarify product rules:** confirm activity capacity, registration deadlines, and what happens when an activity becomes closed. Capacity and deadlines are currently future improvements, so the team should explicitly document the MVP behavior if needed.
- **Measure the core outcome:** track whether students can complete discovery-to-registration successfully, rather than measuring feature count.

6. Overall PM Evaluation

Overall: Strong MVP direction, but user validation and a few product-policy decisions are still needed. The PRD is well aligned with the team's constraints and has a strong product boundary. Its biggest weakness is not technical detail; it is evidence that the problem and proposed workflow match actual student behavior. As Product Manager, I would approve the current MVP direction conditionally, with user validation and final clarification of acceptance/product rules as the next priorities.
